Syncade Recipe Objects

- Standardize common workflow recipe operations
- Build recipes quickly with best practices
- Access fully supported work instructions, behaviors, and web services

Overview
Standard recipe objects in the Syncade manufacturing execution system (MES) improve the recipe authoring experience by providing supported building blocks for common operations. Recipe objects are small subsets of work that consist of work instructions, instruction text, behaviors, and parameters that can be used right out of the box. Parameters that require configuration are identified and simplified so you can build and execute recipes quickly.

Use Best Practices in Recipe Creation
Standard recipe objects use Emerson best practices, enabling you to build recipes quickly and with a proven format. By using standard recipe objects, guideline consistency is naturally enforced between recipe authors. All objects use standard behaviors, and most are built to handle lists.

Supported Recipe Objects

**Data Evaluate.** Evaluate an output value based on a given expression, which can be in string, integer, and real data types.

**DeltaV Functions.** Create and remove a DeltaV campaign. Specify standard batches and up to two miscellaneous batches. Return the status of a specified DeltaV batch.

**Equipment Check.** Scan equipment barcodes to validate equipment status and properties. Check which class of equipment the specified piece belongs to and validate equipment events.

**Equipment Properties.** Retrieve standard and custom properties for a piece of equipment. Set custom equipment properties.

**Equipment Events.** Perform events on multiple pieces of equipment within a single equipment class.

**Material Functions.** Perform material functions such as read standard properties, read/write custom properties, move inventory, modify quality status, and modify quality dates.
Create Output and Return to Inventory. Create an output lot for an order returned to inventory. Modify the quality status and date of the output lot.

Display Message in User Interface. Display messages or instructions that have been preconfigured in the Resource Editor. Defer workflow parameter values from interface view.

Print Label. Print labels based on type and parameters, with the option to reprint as needed.

Scale Functions. Perform functions on a specified scale, including connection, change unit of measure, tare, read, zero, reset, read tare, scale information, and reset tare.

Dispense in Workflow. Dispense items for a given weigh sequence using the Weigh and Dispense module.

Area Dispense and Charge. Automatically area dispense a designated amount from an inventory container. Check inventory container quality status, material code, and quantity prior to dispensing and charging.

Use a standard recipe object to perform an equipment event.
